Question 1
Correct

Mark 1.00 out of 1.00

Given two numbers, write a C program to swap the given numbers.

For example:

Input	Result
10 20	20 10

```
11/17/24, 11:44
AM
```

```
#include<stdio.h>
 1
    int main()
 3
▼
4
    \{
         int a,b,c;
scanf("%d %d",&a,&b);
 5
         c=a;
 6
         a=b;
 7
         b=c;
8
9
10
         printf("%d %d",a,b);
```

	Input	Expected	Got	
~	10 20	20 10	20 10	~

Passed all tests! 🗸

Question 2

Correct

Mark 1.00 out of 1.00

Write a C program to find the eligibility of admission for a professional course based on the following criteria:

Marks in Maths >= 65 Marks in Physics >= 55 Marks in Chemistry >= 50 Or Total in all three subjects >= 180

Sample Test Cases

Test Case 1

Input

70 60 80

Output

The candidate is eligible

Test Case 2

Input

50 80 80

Output

The candidate is eligible

Test Case 3

Input

50 60 40

Output

The candidate is not eligible

```
1  #include<stdio.h>
2  int main()
3  {
    int a,b,c;
    scanf("%d %d %d",&a,&b,&c);
    if((a>=65 && b>=55 && c>=50) || (a+b+c)>=180)
```

.

Question 3
Correct

Mark 1.00 out of 1.00

Malini goes to BestSave hyper market to buy grocery items. BestSave hyper market provides 10% discount on the bill amount B when ever the bill amount B is more than Rs.2000.

The bill amount B is passed as the input to the program. The program must print the final amount A payable by Malini.

Input Format:

The first line denotes the value of B.

Output Format:

The first line contains the value of the final payable amount A.

Example Input/Output 1: Input:

1900

Output:

1900

Example Input/Output 2: Input:

3000

Output:

2700

```
#include<stdio.h>
 2
     int main()
 3
▼
4
     {
         int s;
         scanf("%d",&s);
 5
         if(s<=2000)
 6
         {
 7
▼
8
              printf("%d",s);
         }
 9
         else
10
         {
              int d= s*0.1;
11
▼
              s=s-d;
12
              printf("%d",s);
13
         }
14
15
16
```

	Input	Expected	Got	
~	1900	1900	1900	~

~				
~	3000	2700	2700	~

Passed all tests! 🗸

Marks for this submission: 1.00/1.00.

1.

Question 4
Correct

Mark 1.00 out of 1.00

Baba is very kind to beggars and every day Baba donates half of the amount he has when ever a beggar requests him. The money M left in Baba's hand is passed as the input and the number of beggars B who received the alms are passed as the input. The program must print the money Baba had in the beginning of the day.

Input Format:

The first line denotes the value of M. The second line denotes the value of B.

Output Format:

The first line denotes the value of money with Baba in the beginning of the day.

Example Input/Output:

Input:

100

2

Output:

400

Explanation:

Baba donated to two beggars. So when he encountered second beggar he had 100*2 = Rs.200 and when he encountered 1st he had 200*2 = Rs.400.

```
#include<stdio.h>
 2
    int main()
 3
▼
         int a,b;
 4
         scanf("%d %d",&a,&b);
 5
         for(int i=0;i<b;i++)</pre>
 6
 7
▼
              a*=2;
 8
         printf("%d",a);
9
10
11
```

	Input	Expected	Got

Passed all tests! 🗸

Question 5

Mark 1.00 out of 1.00

The CEO of company ABC Inc wanted to encourage the employees coming on time to the office. So he announced that for every consecutive day an employee comes on time in a week (starting from Monday to Saturday), he will be awarded Rs.200 more than the previous day as "Punctuality Incentive". The incentive I for the starting day (ie on Monday) is passed as the input to the program. The number of days N an employee came on time consecutively starting from Monday is also passed as the input. The program must calculate and print the "Punctuality Incentive" P of the employee.

Input Format:

The first line denotes the value of I.

The second line denotes the value of N.

Output Format:

The first line denotes the value of P.

Example Input/Output:

Input:

500 3

Output:

2100

Explanation:

On Monday the employee receives Rs.500, on Tuesday Rs.700, on Wednesday Rs.900 So

total = Rs.2100

```
#include<stdio.h>
    int main()
 2
    {
 3
▼
4
         int a,b,sum=0;
         scanf("%d %d",&a,&b);
 5
         for(int i=0;i<b;i++)</pre>
 6
         {
 7
▼
              sum+=a;
 8
              a+=200;
 9
         printf("%d",sum);
10
11
12
```

	Input	Expected	Got	
~	500 3	2100	2100	~

Passed all tests! 🗸

Question 6
Correct

Mark 1.00 out of 1.00

Two numbers M and N are passed as the input. A number X is also passed as the input. The program must print the numbers divisible by X from N to M (inclusive of M and N).

Input Format:

The first line denotes the value of M The second line denotes the value of N The third line denotes the value of \boldsymbol{X}

Output Format:

Numbers divisible by X from N to M, with each number separated by a space.

Boundary Conditions:

Example Input/Output 1:

Input:

2

40 7

Output:

35 28 21 14 7

Example Input/Output 2:

Input:

66

121

11

Output:

121 110 99 88 77 66

```
#include<stdio.h>
 2
    int main()
    {
 3
▼
4
         int a,b,c;
         scanf("%d %d %d",&a,&b,&c);
 5
         for(int i=b;i>=a;i--)
 6
 7
▼
              if(i%c==0)
 8
              {

Question 1
Correct
Mark 1.00 out of 1.00
```

```
Convert the following algorithm into a program and find its time complexity using the counter method.

void function (int n)

{

int i= 1;
```

```
int s =1;
```

```
while(s <= n)
{
    i++;
    s += i;
}

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:
    A positive Integer n
Output:
Print the value of the counter variable</pre>
```

For example:

Input	Result
9	12

```
#include<stdio.h>
 2
    void function (int n)
 3
▼
    {
         int count=0;
 4
         int i= 1;
 5
         count++;
 6
         int s =1;
 7
         count++;
 8
         while(s <= n)</pre>
 9
10
             count++;
11
              i++;
              count++;
12
              s += i;
13
14
              count++;
          }
15
          count++;
16
          printf("%d",count);
17
18
    int main()
19
20
21

```
Question 1
Correct
```

Mark 1.00 out of 1.00

```
Convert the following algorithm into a program and find its time complexity using counter method.

Factor(num) {

{

for (i = 1; i <= num;++i) }

{

if (num % i== 0) }

{

printf("%d ", i);

}

}

Note: No need of counter increment for declarations and scanf() and counter variable printf() statement.

Input:

A positive Integer n

Output:

Print the value of the counter variable
```

Answer:

```
#include<stdio.h>
 2
    #include<stdlib.h>
 3
▼
    int main(){
         int n;
 4
         scanf("%d",&n);
 5

State	Finished
Completed or	n Sunday, 10 November 2024, 12:11 PM
Time taken	6 mins 9 secs
Marks	1.00/1.00
Grade	e 10.00 out of 10.00 (100%)

Question 1
Correct

Mark 1.00 out of 1.00

Given an array nums of size n, return the majority element.

The majority element is the element that appears more than [n / 2] times. You may assume that the majority element always exists in the array.

Example 1:

```
Input: nums = [3,2,3]
Output: 3
Example 2:
```

```
Input: nums = [2,2,1,1,1,2,2]
Output: 2
```

Constraints:

```
\blacksquare == nums.length 1 <= \blacksquare <= 5 * 10<sup>4</sup> 
 \blacksquare 2<sup>31</sup> <= nums[i] <= 2<sup>31</sup> - 1
```

For example:

Input	Result
3	3
3 2 3	
7	2
2 2 1 1 1 2 2	

```
#include<stdio.h>
 2
    int main()
 3
▼
         int n;
 4
         scanf("%d",&n);
 5
         int arr[n];
 6
         for(int i=0;i<n;i++)</pre>
 7
         {
 8
              scanf("%d",&arr[i]);
 9
10
         int maxElement=100;
11
         int frequency[maxElement+1];
         for(int i=0;i<=maxElement;i++)</pre>
12
13
         {
              frequency[i]=0;
14
15
         for(int i=0;i<n;i++)</pre>
16
         {
17
              frequency[arr[i]]++;
18
19
         for(int i=0;i<=maxElement;i++)</pre>
         {
20
              if(frequency[i]>n/2)
21
22

Time taken 2 mins 19 secs	
Marks 1.00/1.00	

Question 1

Correct

Mark 1.00 out of 1.00

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of {1, 2, 5, 10, 20, 50, 100, 500, 1000} valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number. Example

Input:

64

Output:

4

Explanaton:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

Answer: (penalty regime: 0 %)

```
#include <stdio.h>
 2
    void mincoincount(int x)
 3
▼
         int coins[] = {1000, 500, 100, 50, 20, 10, 5, 2, 1};
 4
         int i = 0, count = 0;
 5
         while (x > 0)
 6
         {
 7
▼
             if (x >= coins[i])
 8
                 x -= coins[i];
 9
                 count++;
10
             }
11
             else
12
             {i++;
13
14
         printf("%d\n", count);
15
16
    int main() {
17
         int x;
18
         scanf("%d", &x);
19
▼
         mincoincount(x);
20
         return 0;
21
22
23
```

2-G-Cookies Problem ▶

<u>Dashboard</u> / <u>My courses</u> / <u>CS23331-DAA-2023-AIML</u> / <u>Greedy Algorithms</u> / <u>2-G-Cookies Problem</u>

Started on Monday, 30	O September 2024, 2:09 PM
State Finished	
Completed on Monday, 30) September 2024, 2:10 PM
Time taken 55 secs	
Marks 1.00/1.00	

Question 1
Correct
Mark 1.00 out of 1.00

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child i has a greed factor g[i], which is the minimum size of a cookie that the child will be content with; and each cookie j has a size s[j]. If s[j] >= g[i], we can assign the cookie j to the child i, and the child i will be content. Your goal is to maximize the number of your content children and output the maximum number

Example 1:

Input:

3

123

2 11

Output:

1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content. You need to output 1.

Constraints:

```
1 <= g.length <= 3 * 10^4 0 <=
s.length <= 3 * 10^4 1 <= g[i], s[j]
<= 2^31 - 1
```

```
#include <stdio.h>
     int main() {
 2
         int a, b, i, j, e = 0;
 3
         scanf("%d", &a);
 4
         int x[a];
 5
         for(i=0; i< a; i++)</pre>
 6
         {
 7
              scanf("%d", &x[i]);
         }
 8
         scanf("%d", &b);
 9
10
         int y[b];
         for (i = 0; i < b; i++)
11
         {
12
              scanf("%d", &y[i]);
13
14
         for (i = 1; i < a; i++)
15
16
              for (j = i; j > 0 \&\& x[j] < x[j - 1]; j--) {
17
                  int temp = x[j];
                  x[j] = x[j - 1];
18
                  x[j - 1] = temp;
19
              }
20
21
         for (i = 1; i < b; i++)
22
23
              for (j = i; j > 0 \&\& y[j] < y[j - 1]; j--) {
24
                  int temp = y[j];
25
                  y[j] = y[j - 1];
                  y[j - 1] = temp;
26
▼
27
28
         for (j = 0, i = 0; j < b; j++)
29
30
              if (i < a \&\& y[j] >= x[i])
31
32
                  e++;
33
▼
                  i++;
              }

Grade 10.00 out of 10.00 (100%)

Question 1

Correct

Mark 1.00 out of 1.00

```
A person needs to eat burgers. Each burger contains a count of calorie. After eating the burger, the person needs to run a
distance to burn out his calories.
If he has eaten i burgers with c calories each, then he has to run at least 31 * c kilometers to burn out the calories. For
example, if he ate 3
burgers with the count of calorie in the order: [1, 3, 2], the kilometers he needs to run are (3^{\theta} * 1) + (3^{1} * 3) + (3^{2} * 2) = 1
+ 9 + 18 = 28.
But this is not the minimum, so need to try out other orders of consumption and choose the minimum value. Determine the minimum
he needs to run. Note: He can eat burger in any order and use an efficient sorting algorithm. Apply greedy approach to solve the
problem.
Input Format
First Line contains the number of burgers
Second line contains calories of each burger which is n space-separate integers
Output Format
Print: Minimum number of kilometers needed to run to burn out the calories
Sample Input
5 10 7
Sample Output
76
```

For example:

Test	Input	Result

Playing with Chessboard:

Ram is given with an n*n chessboard with each cell with a monetary value. Ram stands at the (0,0), that the position of the top left white rook. He is been given a task to reach the bottom right black rook position (n-1, n-1) constrained that he needs to reach the position by traveling the maximum monetary path under the condition that he can only travel one step right or one step down the board. Help ram to achieve it by providing an efficient DP algorithm.

Example:

Input

3

124

234 871

Output:

19

Explanation:

Totally there will be 6 paths among that the optimal is Optimal path value:1+2+8+7+1=19 $\,$

Input Format

First Line contains the integer n

The next n lines contain the n*n chessboard values

Output Format

Print Maximum monetary value of the path

```
1
     #include<stdio.h>
 2
     #include<stdlib.h>
    int max(int n,int chess[n][n])
 3
 4
▼
         int dp[n][n];
 5
         dp[0][0]=chess[0][0];
 6
         for(int j=1;j<n;j++)</pre>
 7
         {
 8
              dp[0][j]=dp[0][j-1]+chess[0][j];
 9
10
         for(int i=1;i<n;i++)</pre>
11

3-DP-Longest Common Subsequence ▶

<u>Dashboard</u> / <u>My courses</u> / <u>CS23331-DAA-2023-AIML</u> / <u>Dynamic Programming</u> / <u>3-DP-Longest Common Subsequence</u>

Started on Sunday, 10 November 2024, 12:56 PM
State Finished
Completed on Sunday, 10 November 2024, 1:04 PM
Time taken 7 mins 47 secs
Marks 1.00/1.00
Grade 10.00 out of 10.00 (100%)

Question 1
Correct

Mark 1.00 out of 1.00

Given two strings find the length of the common longest subsequence(need not be contiguous) between the two.

Example:

s1: ggtabe

s2: tgatasb

a g g t a b s^2 g x t x a y b

The length is 4

Solveing it using Dynamic Programming

For example:

Input	Result
aab	2
azb	

```
#include<stdio.h>
 2
     #include<stdlib.h>
 3
    int main()
 4
▼
         char a[11],b[11];
 5
         scanf("%10s",a);
 6
         scanf("%10s",b);
 7
         int n=0,count=0;
 8
         for(int i=0;i<sizeof(a);i++)</pre>
 9
10
•
11
              if(a[i]=='\0')
12
•
                   break;
              }
13
              else
14
              {
15
                   n++;
16
▼
17
         for(int i=0;i<n;i++)</pre>
18
19
              if(a[i]==b[i])
20
21
                   count++;
22
              }
23
▼
         printf("%d",count);
24
25
26
27
28
```

Grade 10.00 out of 10.00 (100%)

```
Question 1
```

Correct

Mark 1.00 out of 1.00

Problem statement:

Find the length of the Longest Non-decreasing Subsequence in a given Sequence.

Eg:

Input:9

Sequence:[-1,3,4,5,2,2,2,2,3]

the subsequence is [-1,2,2,2,2,3]

Output:6

```
#include<stdio.h>
 2
     int longest(int arr[],int n)
 3
         int 1[n];
 4
         for(int i=0;i<n;i++)</pre>
 5
 6
▼
              l[i]=1;
 7
         for(int i=1;i<n;i++)</pre>
 8
 9
10
              for(int j=0;j<i;j++)</pre>
11
                   if(arr[i]>=arr[j]&&l[i]<l[j]+1)</pre>
12
▼
                   {
13
                       l[i]=l[j]+1;
14
▼
                   }
              }
15
16
         int max_len=0;
17
         for(int i=0;i<n;i++)</pre>
18
19
              if(l[i]>max_len)
20
21
                   max_len=1[i];
22
              }
23
▼
         return max_len;
24
25
     int main()
26
27
         int n;
28
         scanf("%d",&n);
29
         int arr[n];
30

Correct

Mark 1.00 out of 1.00

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[j] - A[i] = k, i != j.

Input Format:

First Line n - Number of elements in an array Next n

Lines - N elements in the array

k - Non - Negative Integer

Output Format:

1 - If pair exists

0 - If no pair exists

Explanation for the given Sample Testcase: YES as 5

- 1 = 4

So Return 1.

For example:

Input	Result
3	1
1 3 5	
4	

```
#include<stdio.h>
    int main()
 2
 3
▼
         int n,k,flag=0;

Correct

Mark 1.00 out of 1.00

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[j] - A[i] = k, i != j.

Input Format:

First Line n - Number of elements in an array Next n

Lines - N elements in the array

k - Non - Negative Integer

Output Format:

1 - If pair exists

0 - If no pair exists

Explanation for the given Sample Testcase: YES as 5

- 1 = 4

So Return 1.

For example:

Input	Result	
3	1	
1 3 5		
4		

```
#include<stdio.h>
    int main()
 2
 3
▼
         int n,k,flag=0;
 4
         scanf("%d",&n);
 5
         int arr[n];
 6
         for(int i=0;i<n;i++)</pre>
 7
         {
 8
▼
              scanf("%d",&arr[i]);
 9
         }
         scanf("%d",&k);
10
         for(int i=0;i<n;i++)</pre>
11
12
              for(int j=0;j<n;j++)</pre>
13
14
                   if(arr[j]-arr[i]==k && i!=j)
15
▼
16
                       flag=1;
                       break;
17
▼
                   }
18
              }
19
20
         if(flag)
21
         {
22
              printf("1");
23
         }
24
▼
         else
         {
25
              printf("0");
